

Features

- Single-Supply Operation from 2.5V~+5.5V
- Rail-to-Rail Output
- -3dB Bandwidth(G=+1): 150MHz (Typ.)
- Low Input Bias Current: 1pA (Typ.)
- Quiescent Current: 2.8mA/Amplifier (Typ.)
- Operating Temperature: -40°C ~ +125°C
- Small Package:
 - CBM8051 Available in SOT23-5 and SC70-5 Packages
 - CBM8052 Available in SOP-8 and MSOP-8 Packages
 - CBM8054 Available in SOP-14 and TSSOP-14 Packages
 - CBM8051N Available in SOT23-6 and SC70-6 Packages
 - CBM8052N Available in MSOP-10 Packages

Application

- CCD Imaging System
- Photo diode Preamp
- DVD/CD
- Filters
- Professional Video and Cameras
- Hand Sets
- Base Stations
- to-D Driver

Description

The CBM8051 / 1N (single), CBM8052 /2N(dual), CBM8054 (quad) are rail-to-rail output voltage feedback amplifiers offering ease of use and low cost. They have bandwidth and slew rate typically found in current feedback amplifiers. All have a wide input common-mode voltage range and output voltage swing, making them easy to use on single supplies as low as 2.5V. Despite being low cost, the CBM8051 series provide excellent overall performance. They offer wide bandwidth to 250MHz (G =+1) along with 0.1dB flatness out to 52MHz (G= +2) and offer a typical low power of 2.8mA/amplifier.

The CBM8051 series is low distortion and fast settling make it ideal for buffering high speed A/D or D/A converters. The CBM8051/2N has a power-down disable feature that reduces the supply current to 50µA. These features make the CBM8051/2N ideal for portable and battery-powered applications where size and power are critical. All are specified over the extended -40 °C to +125°C temperature range.

Application Notes

Driving Capacitive Loads

CBM805X series op amps are unity-gain stable and suitable for a wide range of general-purpose applications. The small footprints of the CBM805X series packages save space on printed circuit boards and enable the design of smaller electronic products.

Power Supply Bypassing and Board Layout

CBM805X series operates from a single 2.5V to 5.5V supply or dual $\pm 1.25\text{V}$ to $\pm 2.75\text{V}$ supplies. For best performance, a $0.1\mu\text{F}$ ceramic capacitor should be placed close to the VDD pin in single supply operation. For dual supply operation, both VDD and VSS supplies should be bypassed to ground with separate $0.1\mu\text{F}$ ceramic capacitors.

Low Supply Current

The low supply current (typical 2.8mA per channel) of CBM805X series will help to maximize battery life. They are ideal for battery powered systems

Operating Voltage

CBM805X series operate under wide input supply voltage (2.5V to 5.5V). In addition, all temperature specifications apply from -40°C to $+125^{\circ}\text{C}$. Most behavior remains unchanged throughout the full operating voltage range. These guarantees ensure operation throughout the single Li-Ion battery lifetime

Rail-to-Rail Output

Rail-to-Rail output swing provides maximum possible dynamic range at the output. This is particularly important when operating in low supply voltages. The output voltage of CBM805X series can typically swing to less than 8mV from supply rail in light resistive loads ($>1\text{k}\Omega$), and 30mV of supply rail in moderate resistive loads (150Ω).

Capacitive Load Tolerance

The CBM805X family is optimized for bandwidth and speed, not for driving capacitive loads. Output capacitance will create a pole in the amplifier's feedback path, leading to excessive peaking and potential oscillation. If dealing with load capacitance is a requirement of the application, the two strategies to consider are (1) using a small resistor in series with the amplifier's output and the load capacitance and (2) reducing the bandwidth of the amplifier's feedback loop by increasing the overall noise gain. Figure 2. shows a unity gain follower using the series resistor strategy. The resistor isolates the output from the capacitance and, more importantly, creates a zero in the feedback path that compensates for the pole created by the output capacitance.

Figure 2. Indirectly Driving a Capacitive Load Using Isolation Resistor

The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. However, if there is a resistive load R_L in parallel with the capacitive load, a voltage divider (proportional to R_{ISO}/R_L) is formed, this will result in a gain error.

The circuit in Figure 3 is an improvement to the one in Figure 2. R_F provides the DC accuracy by feed-forward the V_{IN} to R_L . C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving the phase margin in the overall feedback loop. Capacitive drive can be increased by increasing the value of C_F . This in turn will slow down the pulse response.

Figure 3. Indirectly Driving a Capacitive Load with DC Accuracy

Typical Application Circuits

Differential amplifier

The differential amplifier allows the subtraction of two input voltages or cancellation of a signal common to the two inputs. It is useful as a computational amplifier in making a differential to single-end conversion or in rejecting a common mode signal. Figure 4. shown the differential amplifier using CBM805X.

Figure 4. Differential Amplifier

$$V_{OUT} = \left(\frac{R_1 + R_2}{R_3 + R_4} \right) \frac{R_4}{R_1} V_{It} - \frac{R_2}{R_1} V_{It} + \left(\frac{R_1 + R_2}{R_3 + R_4} \right) \frac{R_3}{R_1} V_{Rth}$$

If the resistor ratios are equal (i.e. R1=R3 and R2=R4), then

$$V_{OUT} = \frac{R_2}{R_1} (V_{It} - V_{It}) + V_{Rth}$$

Low Pass Active Filter

The low pass active filter is shown in Figure 5. The DC gain is defined by $-R_2/R_1$. The filter has a -20dB/decade roll-off after its corner frequency $f_c = 1/(2\pi R_3 C_1)$.

Figure 5. Low Pass Active Filter

Driving Video

The CBM805x can be used in video applications like in Figure 6.

Figure 6. Typical video driving
